MINI PROJECT

CERTIFICATE

This Mini Project duly signed in this Documentation represents the bonafide works by:

NAME: NINAD A PATIL

ROLL NO: 33

NAME: SARATH SHANKARANARAYANAN

ROLL NO: 41

For SEMESTER – III of Second Year of the Master in Computer Application (MCA) [Afternoon Shift] during the academic year 2020 – 2021.

Lecturer In-Charge

Head, Department of MCA

Lab Incharge

External Examiner

ACKNOWLEDGEMENT

It is in good fortune that we find the opportunity to express our deep sense of gratitude to all those people who helped us with their guidance and assistance without which this project would not be possible.

The successful completion of any task would be incomplete without the mention of those people whose cooperation made it possible, whose constant guidance and encouragement crown all our efforts with success.

We would like to give our heartiest thanks to the Project guide, **Prof. SUNNY NAHAR, Prof. VAISHALI GATTY, AND Prof. KAJAL JEWANI** giving us their precious time, incessant encouragement, and for his valuable advice and guidance without which this project would not have seen the light of day.

We also thank our group members and colleagues who have helped in the successful completion of this project. And last but not least, we would like to thank all those who contributed to this project either morally or materially. Thank you all.

ABSTRACT

“Car Sales System” is a project which will keep all the records of the cars such as adding car details, editing details and deleting details. This project can be used at any cars showroom as we know it is not possible to keep so many records of cars and its specifications such as price, manufactured years, etc. This project manages very smoothly from keeping the records of all the car details. Since all the data is stored in the database such as adding car records, editing records and deleting the car details. This system can save lots of time in managing and editing car records and it also create less chaos and function very smoothly.

The main objective of the Car Sales System is to manage the details of cars. It is an application that computerizes the conventional of car sales procedure which we are aware of. This is a windows-based application which helps in managing data related to the buyers and sellers of the cars. It manages all the information about car manufactures and prices. The project is totally built at administrative end and thus only the administrator is guaranteed the access. The purpose of the project is to build an application program to reduce the manual work for managing the cars information. It tracks all the details about car manufacture, years, model, price, kilometre travelled and any extra information's. The existing system carries more time to do a piece of work for this reason the Car Sales System is implemented.

EXISTING SYSTEM

There is hardly any proper smooth system is available for now to maintain the records of cars, as no proper records are available which leads to much chaos and time consuming. If the sales manager needs to know the details of cars before customers ask them and he don't have a proper record of it, this will lead to mismanagement and lack of maintaining large records. Most of car showroom managements currently use a manual system for the management and maintenance of car information. The current system requires numerous paper forms, with data stores spread throughout the car showroom infrastructure. Often information is incomplete or does not follow management standards. Multiple copies of the same information exist in car showroom and may lead to inconsistencies in data in various data stores. The customers have to wait for long time to get the proper details of cars and it will waste lot of time in finding the data.

PROPOSED SYSTEM

This system will make the entire process very smooth and efficient with just a click of help. This system will maintain all sorts of data like adding, editing and deleting car records so it will be easy to allocated the car information's.

This application mainly consists of 4 modules:

- Admin module
- Add module
- Edit module
- Delete module.

Admin Module: This module is purely admin of this application. In this the admin can add, edit, view and delete the records of car details.

Add Module: In add module the admin can add car records such as car manufacture, car year, car model, car price, kilometer travelled and any extra information's.

Edit Module: In edit module the admin can edit car records depends on changes of the car such as kilometer travelled or price or any extra information's.

Delete Module: In delete module the admin can delete the record of the car if the car has been purchased by the customers and has been transferred to any other showroom.

PURPOSE OF THE SYSTEM

- All the records and data have been computerized and are now persistent.
- Access to all types of records made easy.
- Manage the information of records.
- This system is User-friendly, interactive and easy to use.
- It has the capacity of storing huge data and keeping it safe.
- Save excess paper work.
- Avoiding confusion, data getting misplaced, time saving and no complexities.
- Data security facility.
- Easy navigation through the records is provided.
- Provides security to data through authorization.

HARDWARE/SOFTWARE SPECIFICATIONS

HARDWARE REQUIREMENT

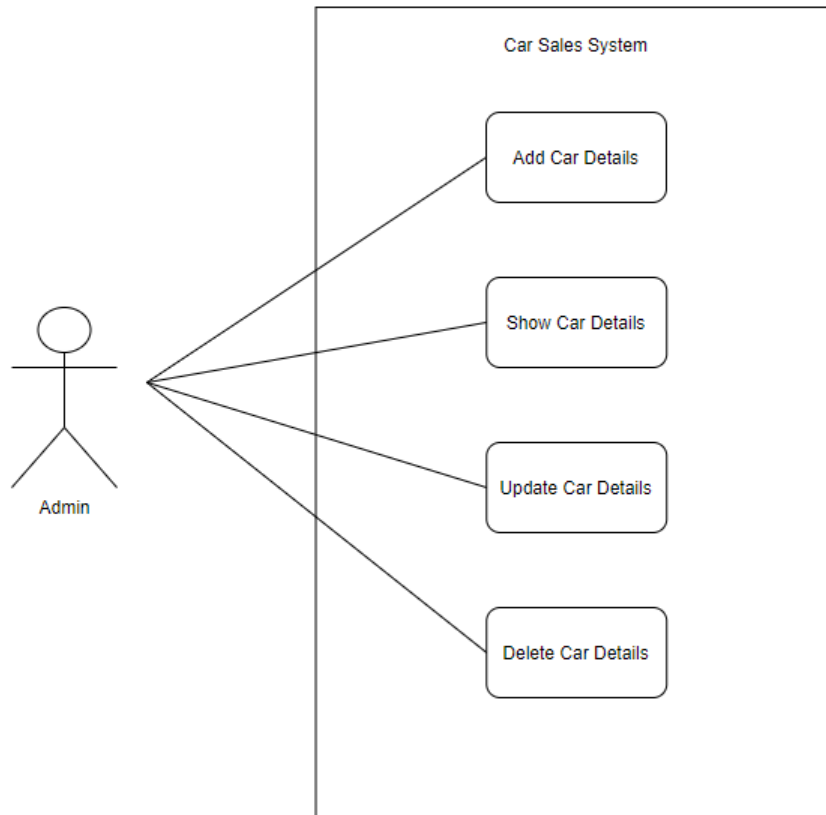

- Intel(R) Core (TM) i5-4440 CPU @ 3.10GHz
- 4 GB DDR3 RAM.
- 10 GB Hard Disk

SOFTWARE REQUIREMENT:

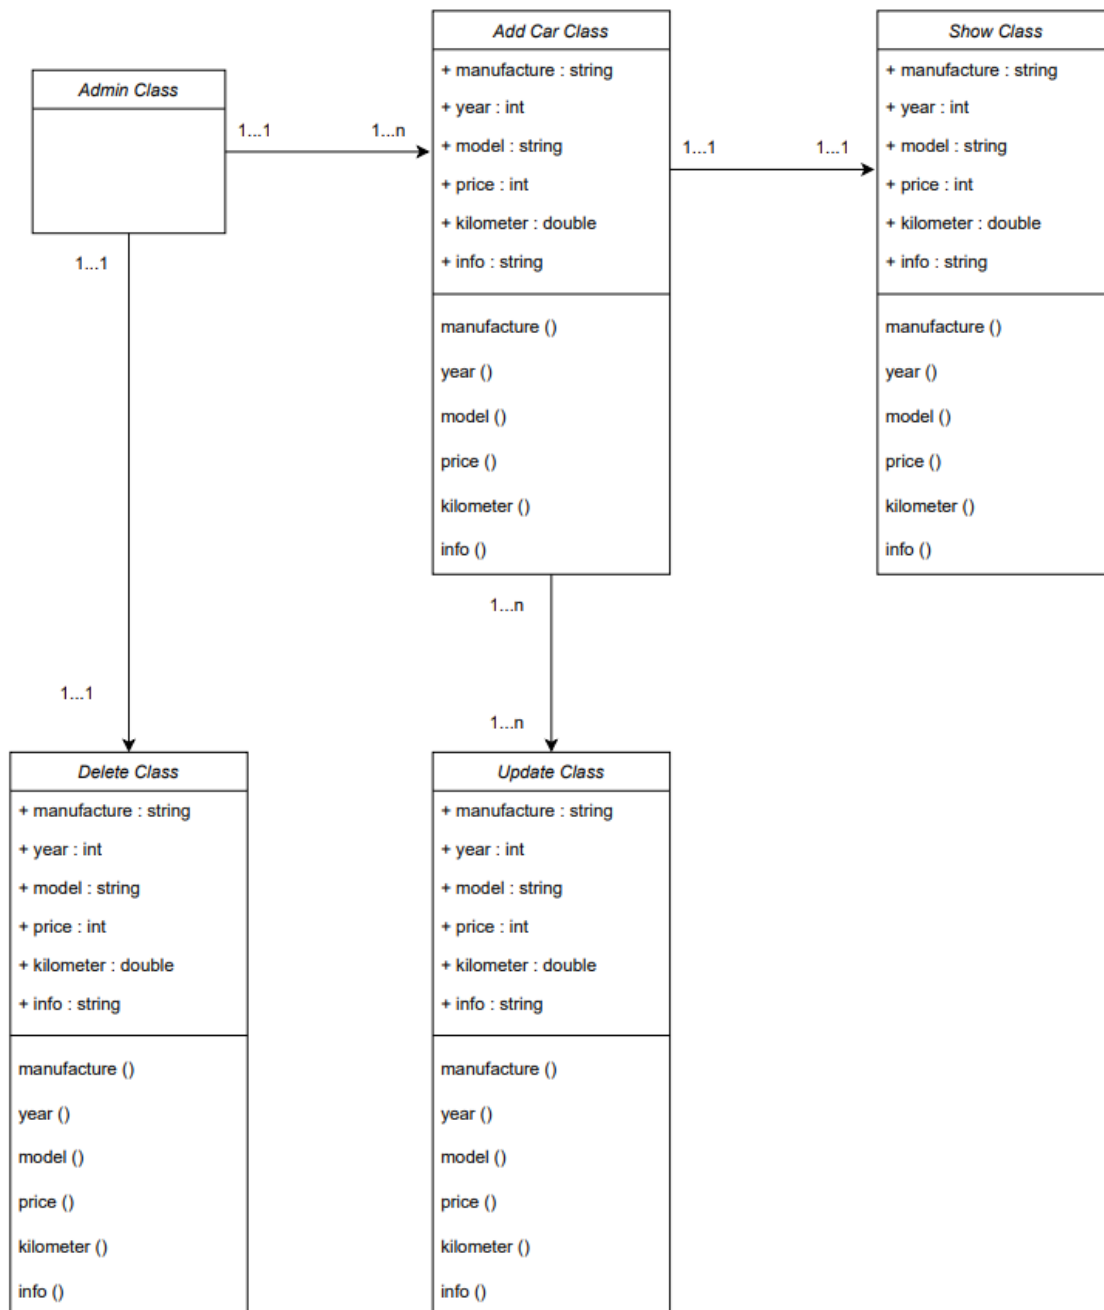

- **Operating System:** Windows 7, Windows 8
- **Software Used:** NetBeans, Xampp and MS Word
- **Programming Language:** Java, AWT, Swing and JDBC

SCREENSHOTS

ADMIN LOGIN

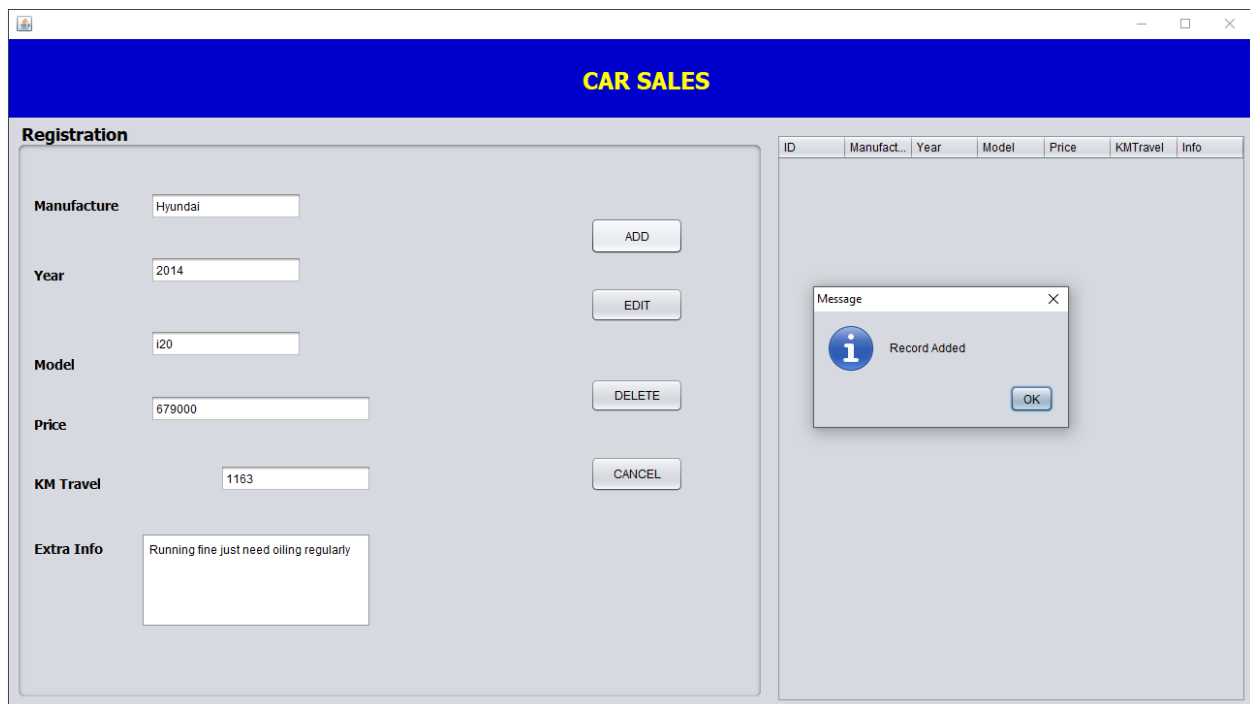

A screenshot of an Admin Login window. The window has a red border and a light gray background. It contains two input fields: 'Username' and 'Password'. Below the 'Password' field are two buttons: 'SIGNIN' and 'CANCEL'.

Username

Password

ADD MODULE

A screenshot of the 'CAR SALES' system's 'Registration' module. The window has a blue header bar with the text 'CAR SALES'. Below the header, there is a 'Registration' section with several input fields and buttons. The input fields are labeled 'Manufacture', 'Year', 'Model', 'Price', 'KM Travel', and 'Extra Info'. The buttons are 'ADD', 'EDIT', 'DELETE', and 'CANCEL'. A message box is displayed over the 'ADD' button, indicating 'Record Added'.

FUTURE SCOPE

A lot of features or functionalities can be added into this system such as searching of data, buying or selling of cars. Some more modules can also be added so as to better retrieve the car information details. This is not the overall description about the Car Sales System. Further enhancements can be made in designing the more screens. Some more design can also be added in the particular existing system.

CONCLUSION

Car Sales System is a customizable and user-friendly software designed for small showroom which has administrator module which can enter add car details, edit details and delete details. It has been designed to automate, manage and look after the overall processing of even very large data of cars. Car Sales System is offering a maximum stability, cost-effectiveness and usability. It provides the most flexible and adaptable standards for managing system software solutions for car showroom. The project can be expanded into a domain for reviews and comparing models of cars.
